### Notes on the Care and Handling of Dichroic Glass:

The coating on Dichroic glass is vulnerable to scratches and damage from solvents, oils, adhesives, and fluxes. Therefore, the glass should be handled carefully and protected from abrasions. When necessary, Dichroic glass can be cleaned using mild soap and water or a mild glass cleaner and dried with a soft cloth.

### Leaded Glass Application

When fabricating a panel designed to include Dichroic glass, use a cutter without oil, and score the glass on the uncoated side. The coating can be protected from soldering and grouting phases by covering it with low tack tape or contact paper that is easily removed when finished (be sure to test first with a small scrap piece of glass).

### Lamination Application

Some Dichroic jewels and bevels are made by laminating the clear bevel to a coated sheet of thin float glass. This process layers the coating between the glass and the jewel, and thus it is protected from the dangers listed above.

### Fused Glass Application

Fusing Dichroic glass not only produces captivating effects, it eliminates all the vulnerabilities listed above as well. The fusing process molecularly binds the glass and the coating materials. Reflective colors difficult to perceive on clear glass will intensify when fused onto a background of black glass. Clear glass offers versatility as it can be fused with Dichroic coating either up or down. When fused Dichroic side down, the coating will be encased in a layer of clear. When fused Dichroic side up, a soft metallic effect is achieved.

### Anmerkungen zum Umgang und zur Behandlung des Dichroic Glases:

Die Schicht auf Dichroic Glas ist anfällig für Kratzer und für die Beschädigung durch Lösungsmitteln, Öle, Kleber und Flussmittel. Folglich sollte das Glas sorgfältig angefasst werden und vor Abnutzungen geschützt werden. Falls notwendig kann Dichroic Glas mit milder Seife und Wasser oder einem milden Glasreinigungsmittel gesäubert werden und mit einem weichen Tuch getrocknet werden.

Bei Arbeiten mit Dichroic Glas, benutzen Sie bitte einen Glasschneider ohne Öl, und schneiden Sie das Glas auf der unbeschichteten Seite. Die Schicht kann vor den lötvenden und überziehenden Phasen geschützt werden, indem man es mit dünnen Klebeband oder Kontaktpapier bedeckt, das leicht entfernt werden kann, wenn es fertig gestellt ist. (Vor der Entfernung an einem kleinen Reststück Glas prüfen).

Einige Dichroic-Muggelsteine und Facetten werden hergestellt, indem man die klare Facette mit einer überzogenen Schicht des dünnen Floatglases laminiert. Dieser Prozeß überlagert die Schicht zwischen dem Glas und dem Muggelstein, und wird folglich vor den Gefahren geschützt, die oben beschrieben werden.

Das Fusen von Dichroic Glas produziert nicht nur faszinierende Effekte, es beseitigt auch die ganzen Anfälligkeiten, die oben beschrieben werden. Der Fusingprozeß bindet molekular das Glas und die beschichteten Materialien. Die reflektierenden Farben, die schwierig auf freiem Glas wahrzunehmen sind verstärkt, wenn sie auf einen Hintergrund von schwarzen Glas fixiert werden. Klares Glas bietet eine vielseitige Verwendbarkeit, weil es mit der Dichroic Schicht entweder oben oder unten geschmolzen werden kann. Wenn die Dichroic Seite unten geschmolzen ist, wird die Beschichtung in einer Schicht von klaren Glas eingehüllt. Wenn die Dichroic Seite oben fixiert ist, wird ein weicher metallischer Effekt erreicht.

**35 330 10 magenta - teal  
Farbwechsel von Dichroic-  
Glas unter veränderten  
Blickwinkeln.  
Changing the angle of  
viewing results in varying  
color combinations.**

**Wichtige Information für die  
Verarbeitung von Dichroic  
Gläsern**

Beim Verschmelzen von  
identischen Dichroic Gläsern kann  
es zu Farbabweichungen im  
Endprodukt kommen.

**Important information for  
working with dichroic glass:**

When fusing identical dichroic  
glasses, color deviations can occur  
in the final product.

**Was ist Dichroic Glas :**

Dichroic ist eine high-tech optische Schicht, die selektiv bestimmte Wellenlängen (Farben) des Lichtes reflektiert und die restlichen Wellenlängen durchlassen läßt. Dieser gleiche Effekt wird in der Natur in Pfaufedern und Opalen gesehen. Das Wort "Dichroic" bedeutet zwei Farben, welches sich auf die übertragene Farbe und reflektierte Farbe bezieht. Der beschichtende Prozeß erfolgt in einem hohen Vakuumraum, der einige Spezialgeräte als Ausrüstung hat um den beschichtenden Prozess zu steuern und zu überwachen.

**What is Dichroic Glass:**

Dichroic is a high-tech optical coating that selectively reflects certain wavelengths (colors) of light and allows the remaining wavelengths to transmit through. This same effect is seen in nature in peacock feathers and opals. The word "dichroic" means two colors, which refers to transmitted color and reflected color. The coating process is done in a high vacuum chamber that has several pieces of specialized equipment to control and monitor the coating process.

Da der Charakter des Dichroic-Glases der Wechsel ist, ist es nahezu unmöglich diese Gläser farblich im Katalog abzubilden. Um Ihnen das Prinzip des Glases zu demonstrieren haben wir in einer Bilderfolge ein Glas in verschiedenen Winkeln fotografiert. Wie Sie sehen, könnte jedes Foto auch für ein anderes Glas stehen. Dichroic-Gläser sollten Sie niemals in einer Serie einsetzen wo ein Stück wie das andere sein soll. Dichroic-Gläser sollten Sie immer wie ein Stück Einmaligkeit einsetzen.

The character of dichroic glass is its changeability, which means that it is nearly impossible to illustrate this product on a color catalog page. To demonstrate the principle of dichroic glass, we have taken a series of photos viewed from various angles. As you see, each Foto could be the image of a totally different glass. Dichroic glass should not be used for a series where one piece is to resemble the next. Dichroic glass should always be used to represent a piece of uniqueness.
